

Assignment 4

Molly McPheeters

CIS Class

Over the time of being in the class I have learned lots of good and new information that I will put to good use my next four years here and even when I get a job in the future. The information I have learned about different computers, the different parts inside and outside of a computer, the hardware and the software of them. When I picked this major, it wasn't because of the money or the jobs I would get, I genuinely love listening and learning about the knowledge of computers. I hate coding personally, but I love going inside the computers and motherboards and fixing them and being able to explain to people how to fix them and what everything is in and on them.

The first thing I enjoyed learning about was the Github and wiki. I will admit, during the first assignment I struggled a tremendous amount because I used Github before, but only to upload my code and create code. Since the first assignment, I got the hang of using it and being able to upload stuff and submit it off Github. I love using Github because it makes my assignments and projects more advanced looking and makes it more organized then just having a ton of documents on my computer and in my Google Drive. Since using it, I have looked through the website and I discovered more things about it and have learned new features.

The second topic that really made me interested was when we went over Chapter 3, about computers and mobile devices. Whenever learning about different computers and mobile devices, it makes me more interested because I love that sort of topic. One thing I learned was about Cloud Computing, I did not know what that was and to find out and learn how it refers to an environment of servers that house and provide access to resources users access through the internet. It was something new I did not know and I knew about servers but after that was controlled by them I had no

idea about. Lastly of this chapter, whenever it went over the different mobile devices and computers, it blew my mind the different types of them, who knew an ATM would be a part of this topic but it was. With this chapter, I knew a lot that was already on it and taught, but there were things I did not know and it blew my mind to find out.

The last thing that I really enjoyed listening and learning about was when you were going through the slides about operating systems. The background of the operating systems interest me because it is fun learning how they were made and what parts go into making them. When mentioning the types of operating systems, it is amazing to see that people have created so many different operating systems, but made them look so different from each other. From Linux to Google then to Mac, it is interesting to look into them and see the background of how they originally started to how advanced they are now and the details that really went into creating them.

Overall, I have learned tons of new things from this class over the course of this semester. I love what I majored in, yes I love this class way more than my coding class because I absolutely hate coding, but I love my major. Over the course of this class, I have refreshed my memory with things I have learned in high school, but I have also learned a ton of new topics and things about computer systems and computers that I didn't know existed. All of this information will be put into my major and into the future with my job and my other and upcoming class that I will attend in the future here at Missouri Valley College
